

Introducing the Superfrecator® 6800 series

NOW, A SAFE, NON-INVASIVE TREATMENT THAT PERMANENTLY REMOVES UNSIGHTLY SKIN GROWTHS FROM YOUR FACE AND BODY IN JUST ONE SESSION!

What are skin growths? Skin growths are accumulations of various types of cells that look different from the normal surrounding skin. They may be raised or flat and range in color from dark brown or black to flesh-colored or red. They may be present at birth or develop later as we age.

Are they safe to remove?

In most cases, skin growths are non-cancerous and can be safely removed. The treatment is performed by a professional, certified technician who has been trained to identify the different types of skin growths appropriate for the treatment. All treatments are performed using the strictest sanitary procedures.

What is the Superfrecator®?

The Superfrecator® is a cauterization machine that has been successfully used for over 30 years by skin care professionals to remove all types of common surface skin growths.

How does the Superfrecator® work?

The machine uses a high-frequency electrical current that delivers a precise spark through a micro-probe to cauterize and desiccate skin growths. During the procedure the micro-probe remains above the skin surface; it does not penetrate the skin. As the growth is removed, a natural protective coating of scab develops that covers the treated area.

Within the next few days, the scab will fall off and be replaced by healthy new skin cells, the color of the surrounding skin tissue. In most cases, there is no visible indication of the previous growth.

How does it differ from liquid nitrogen?

The Superfrecator® 6800 series is generally more effective than liquid nitrogen in removing skin growths. Frequently, more than one application of liquid nitrogen is needed to remove a growth, whereas only one Superfrecator® treatment is ever necessary. In addition, Superfrecator® treatments are less expensive.

Is the treatment permanent?

Yes. Once a skin growth has been treated with the Superfrecator®, it does not return. However, if your skin is prone to these types of growths, new ones may appear elsewhere on your face and body.
